## Never Replace a Clogged Diffuser Again

Enviroquip's medium bubble air diffusers are accepted by engineers and operators as truly non-clogging. Clogging is eliminated by separating the air metering orifice from the diffuser and locating the orifice above the liquid level in the basin (Patent #4720360). Other diffusers risk clogging when the air is turned off in a basin, as is frequently done to recover alkalinity. Enviroquip's exceptional diffuser design and above-water orifice mean that solids never have contact with the orifice and air flow is uninhibited through the complete length of the pipe drop. Over time the non-clogging feature results in operations and maintenance savings because blowers can continually operate at design pressure and the diffusers do not require replacement due to clogging. A 20 year warranty covering both parts and labor at no extra cost to the Owner ensures our claims!
